Product-minded backend engineer with 7+ years turning fuzzy requirements into production systems. Built usage-based billing at NT\$5M+ / month and a rule engine that insurers reconfigure without a release. Seeking senior backend roles on AI product teams.

WORK EXPERIENCE

Crescendo Lab, Senior Software Engineer

2025/07 - Present

Tech: Python, FastAPI, React, PostgreSQL, Cloud Run, BigQuery, dbt, Terraform, Pub/Sub

- Built the usage-based credits billing system from GTM/Finance requirements to production, cutting top-up from ~5 days to 3 minutes. It processes NT\$5M+ / month across 13 paid features, with automated revenue recognition.
- Rebuilt billing as a shared platform. Any new paid feature can plug in and start charging within a day.
- Automated product provisioning from HubSpot orders, a setup step CSMs previously configured by hand.

OneDegree, Senior Backend Engineer

2021/10 - 2025/04

Tech: Python, PostgreSQL, SQLAlchemy, GitLab CI

- Led a team of 4 backend engineers; owned sprint planning and mentored the team on system design and career growth.
- Built a rule engine that compiles insurer-authored Excel rules to sandboxed Python, with hand-written Python for complex cases. It drives underwriting, pricing, claims, and dry runs, and changes ship without an engineering release.
- Refactored core insurance modules around business domains, clarifying undocumented logic with PMs before each change.
- Built deployment tooling and status dashboards that the whole engineering team used daily.

SoundOn, Backend Engineer

2020/07 - 2021/07

Tech: Node.js, PostgreSQL, GCP, Kubernetes, BigQuery, Dataflow, CircleCI, Firebase, React, Redux

- Migrated the platform database from Firestore to PostgreSQL with zero downtime, normalizing inconsistent documents during the cutover.
- Built hourly ETL pipelines on BigQuery and Dataflow, aggregating listening stats to power the creator analytics dashboard and podcast leaderboard.
- Ran backend services on GKE and tuned PostgreSQL queries and indexes for high-traffic podcast analytics.

LJIT.io, Frontend/Backend Engineer

2018/05 - 2020/02

Tech: Node.js, Express.js, MongoDB, MySQL, Redis, AWS S3, React/Redux, Webpack, Docker

- Built smart contracts, React / web3 frontends, and backend services across blockchain, streaming, and gaming client projects.

- Ran the team's study group, presenting on SOLID, database isolation levels, and React state management.

EDUCATION

National Central University

2013/09 - 2017/07

Bachelor of Computer Science

SKILLS

- **Languages:** Python, TypeScript/JavaScript
- **Backend:** FastAPI, Node.js/Express, SQLAlchemy, REST APIs, event-driven services, BullMQ
- **Data & Storage:** PostgreSQL, MySQL, MongoDB, Redis, BigQuery, dbt, Dataflow
- **Infrastructure:** GCP (GKE, Cloud Run, Pub/Sub), Kubernetes, Docker, Terraform, CircleCI, GitLab CI
- **Frontend:** React, Redux
- **Tooling:** Claude Code
